

# TIP OF THE WEEK

MODEL: WA200-7, WA270-7 & WA320-7

FEATURE: MAX TRACTION SWITCH

STD/OPT: STD on Multi-function Mono-lever

SUGGESTED SETTING: NA

The MAX Traction switch comes standard on every Multi-function Mono Lever. This switch is used to quickly switch to MAX traction.

This switch allows the operator to leave the machine in AUTO mode, which helps to save fuel. MAX traction is useful when the most tractive effort is needed, for example, when digging into the pile.

The MAX traction switch will put the machine into MAX mode when pressed. The loader will return to the previous traction setting when the switch is pressed again or when the operator changes direction (F → R).

It is recommended that the loader is typically operated in AUTO mode. The MAX switch acts similar to a transmission kick-down on larger loaders.
