

MODEL: WA270-7 & WA320-7

FEATURE: UPPER BOOM POSITIONER

STD/OPT: STANDARD

SUGGESTED SETTING: DEPENDS ON JOB

The upper boom kick-out, or positioner switch, establishes the maximum boom raise height. When set to ON in the monitor panel the switch will be activated.

To set the upper limit, simply raise the boom to the desired level, press and hold the switch until there is a beep. This establishes the upper boom kick-out level.

When set, the upper boom kick out will automatically raise the boom to the established level when the monolever is pulled back into the detent.

Setting the upper boom kick-out can reduce operator fatigue when having to continuously raise the boom to the same level such as during repeated V-cycle loading. This helps the operator save time and operate more efficiently.
