Reverse Confirmation

Komatsu articulated dump trucks are equipped with two hydraulically-driven cooling fans that are independently reversible via the monitor.

The hydraulically driven fans are designed to save fuel and reduce noise. Periodically, as the cooling cores begin to accumulate dust and debris, the operator can independently reverse the rotation of the fans to purge the coolers and maintain optimal cooling system performance.

To reverse the rotation of the radiator and/or aftercooler fans, shut off the engine and open the engine hood. With the key on, navigate to the "Machine Setting and Information" menu on the monitor. Highlight and select which fan to reverse. Confirm that you want to reverse the direction of the fan by pressing the "Enter" switch. Start the engine to rotate the fans in the reverse direction.
